Flying of vector particles from a parity breaking (Chern-Simons) medium to vacuum and back

Alexander A. Andrianov in collaboration with S.S.Kolevatov and R.Soldati

Institut de Ciències del Cosmos, University of Barcelona & Saint-Petersburg State University

A.A., S.Kolevatov, R.Soldati, JHEP 11 (2011) 007

Outline

Maxwell-Chern-Simons Electrodynamics: possible manifestation

- Large-scale universe or galaxies: Carroll-Field-Jackiw model (1990) and cosmic birefringence. Spontaneous generation of MCS Electrodynamics by axion condensation, A.A., R.Soldati (1995).
- b. Parity breaking (PB) in a finite volume: fireballs in heavy ion collisions with a non-zero topological charge and/or neutral pion condensate, chiral magnetic effect, D.Kharzeev, L. McLerran, A Zhitnitsky, K.Fukushima, H.J.Warringa et al; photons and vector mesons in Chern-Simons constant background; A.A., D.Espriu, V.A.Andrianov et al.
- c. Compact dense star filled by axions?
- Finite volume effects: passing through and reflecting from a boundary A.A., S.S.Kolevatov, R.Soldati (2011)
- Quantization: Bogoliubov transformation from vacuum to parity breaking medium and back.

2

・ロト ・回ト ・ヨト ・ヨト

$$\mathcal{L}_{MCS} = -\frac{1}{4} F^{\alpha\beta}(x) F_{\alpha\beta}(x) + \frac{1}{2} m^2 A_{\nu}(x) A^{\nu}(x) + \frac{1}{2} \zeta_{\mu} A_{\nu}(x) \tilde{F}^{\mu\nu}(x) + \text{g.f.}$$

In momentum space wave Eqs.

$$\begin{cases} \left[g^{\lambda\nu}\left(k^2-m^2\right)-k^{\lambda}k^{\nu}+i\varepsilon^{\lambda\nu\alpha\beta}\zeta_{\alpha}k_{\beta}\right]\mathbf{a}_{\lambda}(k)=0\\ k^{\lambda}\mathbf{a}_{\lambda}(k)=0 \end{cases}$$

Projection onto different polarizations with the help of

$$S_{\lambda}^{\nu} = \delta_{\lambda}^{\nu} D + k^{\nu} k_{\lambda} \zeta^{2} + \zeta^{\nu} \zeta_{\lambda} k^{2} - \zeta \cdot k (\zeta_{\lambda} k^{\nu} + \zeta^{\nu} k_{\lambda}); \quad D \equiv (\zeta \cdot k)^{2} - \zeta^{2} k^{2}$$

Transversal polarizations,

$$\pi_{\pm}^{\mu\nu} \equiv \frac{S^{\mu\nu}}{2D} \pm \frac{i}{2} \varepsilon^{\mu\nu\alpha\beta} \zeta_{\alpha} k_{\beta} D^{-\frac{1}{2}}; \quad \varepsilon_{\pm}^{\mu}(k) = \pi_{\pm}^{\mu\lambda} \epsilon_{\lambda}^{(0)}$$

Scalar and longitudinal polarizations,

$$\varepsilon_{S}^{\mu}(k) \equiv \frac{k^{\mu}}{\sqrt{k^{2}}}, \qquad \varepsilon_{L}^{\mu}(k) \equiv \left(D k^{2} \right)^{-\frac{1}{2}} \left(k^{2} \zeta^{\mu} - k^{\mu} \zeta \cdot k \right)$$

臣

- 4 臣 ▶

Transversal polarizations,

$$\begin{aligned} \mathcal{K}_{\nu}^{\mu} \, \varepsilon_{\pm}^{\nu}(k) &= \left(k^2 - m^2 \pm \sqrt{\mathrm{D}}\right) \, \varepsilon_{\pm}^{\mu}(k); \\ \omega_{\mathbf{k},\pm} &= \begin{cases} \sqrt{\mathbf{k}^2 + m^2 \pm \zeta_0 |\mathbf{k}|}; & \zeta_{\mu} = (\zeta_0, 0, 0, 0) \\ \sqrt{\mathbf{k}^2 + m^2 + \frac{1}{2}\zeta_x^2 \pm \zeta_x \sqrt{k_1^2 + m^2 + \frac{1}{4}\zeta_x^2}} & \zeta_{\mu} = (0, -\zeta_x, 0, 0) \end{cases} \end{aligned}$$

CFJ model - **massless photons**: in observations of very remote radio galaxies left-handed and right-handed circular e.m. waves propagate with different velocities. Birefringence!

Polarizations of linearly polarized radio waves could be rotated with distance L!

$$\zeta_0 \ll |\mathbf{k} \quad k_{\pm} \simeq \omega_{\mathbf{k}} \mp \frac{1}{2}\zeta_0; \quad \Delta\phi_{rotation} = \frac{1}{2}(\phi_L - \phi_R) = \frac{1}{2}\zeta L.$$

Distances are of order the Hubble scale $\sim 10^{10}$ l.y. and from the analysis of 160 galaxies with linearly polarized radio waves $\Rightarrow |\zeta| < 10^{-33} {\rm eV} \sim 1/R_{Universe}$ Large-scale Universe is not birefringent! (at low energies)

- Axion background in dense stars and/or as the dark matter [E.W. Mielke, P. Sikivie et al; A. A., D.Espriu, F.Mescia et al]
- Our special interest: PB background inside a hot dense nuclear fireball in HIC !?

(ロ) (同) (E) (E) (E)

$$T_{5}(t) = \frac{1}{8\pi^{2}} \int_{\text{vol.}} d^{3}x \varepsilon_{jkl} \text{Tr}\left(G^{j}\partial^{k}G^{l} - i\frac{2}{3}G^{j}G^{k}G^{l}\right)$$

in a finite volume it may arise from quantum fluctuations in hot $\mathsf{QCD}\xspace$ medium

(due to sphaleron transitions!? [Manton, Rubakov, Shaposhnikov, McLerran])

and survive for a sizeable lifetime in a heavy-ion fireball,

$$\langle \Delta T_5
angle
eq 0$$
 for $\Delta t \simeq \tau_{\text{fireball}} \simeq 5 - 10$ fm,

For this period one can control the value of $\langle \Delta {\cal T}_5 \rangle$ introducing into the QCD Lagrangian a topological chemical potential

$$\Delta L = \mu_{\theta} \Delta T_5, \quad \Delta T_5 = T_5(t_f) - T_5(0) = \frac{1}{8\pi^2} \int_0^{t_f} \int_{\text{vol.}} d^3 x \operatorname{Tr} \left(G^{\mu\nu} \widetilde{G}_{\mu\nu} \right)$$

in a gauge invariant way.

æ

▲圖 → ▲ 国 → ▲ 国 →

Partial conservation of isosinglet axial current broken by gluon anomaly (consider the light quarks only),

$$\partial_{\mu}J_{5}^{\mu}-2im_{q}J_{5}=rac{N_{f}}{8\pi^{2}}\mathrm{Tr}\left(G^{\mu
u}\widetilde{G}_{\mu
u}
ight)$$

predicts the induced chiral (axial) charge

$$rac{d}{dt}\left(Q_5^q-2N_fT_5
ight)\simeq 0, \ \ m_q\simeq 0, \quad Q_5^q=\int_{
m vol.}d^3xar q\gamma_0\gamma_5 q=\langle \underline{N_L-N_R}
angle$$

to be conserved $\dot{Q}^q_5\simeq 0$ (in the chiral limit $m_q\simeq 0$) during $au_{\it fireball}.$

æ

・ 同 ト ・ ヨ ト ・ ヨ ト

Axial chemical potential can be associated with approximately conserved Q_5^q (for u, d quarks!)

$$\Delta L_q = \mu_5^q Q_5^q,$$

to reproduce a corresponding

$$\langle \Delta T_5 \rangle \simeq \frac{1}{2N_f} \langle Q_5^q \rangle, \iff \mu_5^q \simeq \frac{1}{2N_f} \mu_{\theta}$$

LPB to be investigated in e.m. interactions of leptons and photons with hot/dense nuclear matter via heavy ion collisions.

e.m. interaction implies

$$Q_5^q
ightarrow ilde{Q}_5 = Q_5^q - T_5^{
m em}, \quad T_5^{
m em} = rac{1}{16\pi^2} \int_{
m vol.} d^3 x arepsilon_{jkl} A^j \partial^k A^l$$

• μ_5 is conjugated to (nearly) conserved \tilde{Q}_5

- < ∃ →

Bosonization of Q_5^q following VMD prescription

$$egin{aligned} \mathcal{L}_{\mathsf{int}} &= ar{q} \gamma_\mu \hat{V}^\mu q; \quad \hat{V}_\mu \equiv -e A_\mu Q + rac{1}{2} g_\omega \omega_\mu \mathbb{I} + rac{1}{2} g_
ho
ho_\mu^0 au_3, \ &(V_{\mu, a}) \equiv \left(A_\mu, \, \omega_\mu, \,
ho_\mu^0, \phi_\mu
ight), \quad g_\omega \simeq g_
ho \equiv g \simeq 6 \end{aligned}$$

$$\mathcal{L}_{kin} = -\frac{1}{4} \left(F_{\mu\nu} F^{\mu\nu} + \omega_{\mu\nu} \omega^{\mu\nu} + \rho_{\mu\nu} \rho^{\mu\nu} + \phi_{\mu\nu} \phi^{\mu\nu} \right) + \frac{1}{2} V_{\mu,a} (\hat{m}^2)_{a,b} V_b^{\mu}$$

P-odd interaction

$$\mathcal{L}_{\mathsf{mix}} \propto -\frac{1}{4} \varepsilon^{\mu\nu\rho\sigma} \mathsf{Tr} \left[\hat{\zeta}_{\mu} V_{\nu} V_{\rho\sigma} \right] = \frac{1}{2} \mathsf{Tr} \left(\hat{\zeta} \varepsilon_{jkl} \hat{V}_{j} \partial_{k} \hat{V}_{l} \right) = \frac{1}{2} \zeta \varepsilon_{jkl} V_{j,a} N_{ab} \partial_{k} V_{l,b}$$

with $\hat{\zeta}_{\mu}=\hat{\zeta}\delta_{\mu0}$, spatially homogeneous and isotropic background.

Resonance splitting in polarizations (corrected for PHENIX acceptance)

Alexander A. Andrianov Flying of vector particles

Finite volume: passing through boundary

A.A., S.Kolevatov, R.Soldati, JHEP 11 (2011) 007

Mean free paths for vector mesons:

- $L_{
 ho} \sim 0.8 fm$ $\ll L_{fireball} \sim 5 - 10 fm$
- L_ω ~ 16fm ≫ L_{fireball} Why it is relevant in medium? (PHENIX confirms!)

LPB "vacuum"

- \neq empty vacuum
- = coherent state
- of vacuum mesons

Matching on $\zeta \cdot x = 0$

Thus to save energy-momentum conservation transmission must be accompanied by reflection back. Enhancement of in-medium decays of ω mesons!

A possible gauge-invariant choice,

$$-\frac{1}{4}F^{\mu\nu}(x)\widetilde{F}_{\mu\nu}(x)\zeta_{\lambda}x^{\lambda}\theta(-\zeta\cdot x) \Rightarrow \frac{1}{2}\zeta_{\mu}A_{\nu}(x)\widetilde{F}^{\mu\nu}(x)\theta(-\zeta\cdot x),$$

which however associates a space-like boundary with a space-like CS vector $(\zeta_{\mu})(x) = \zeta(0, \vec{a})\theta(-\vec{a} \cdot \vec{x}), \quad |\vec{a}| = 1$.

Compact dense stars filled by axions with density degrading to their surface?!

Another choice: time-like CS vector and space-like boundary $(\zeta_{\mu})(x) = \zeta \left(\theta(-\vec{a} \cdot \vec{x}), -\vec{a}x_0\delta(-\vec{a} \cdot \vec{x}) \right)$ gauge invariance condition $\partial_{\nu}\zeta_{\mu} = \partial_{\mu}\zeta_{\nu}$. Singular interaction on a space-like boundary!

Axial chemical potential for a fireball

* * * * * *

Matching on the boundary $\zeta \cdot x = 0$

$$\delta(\zeta \cdot x) \left[A^{\mu}_{\text{vacuum}}(x) - A^{\mu}_{\text{MCS}}(x) \right] = 0,$$

- (回) (三) (三) (三) (三)

Classical solutions

Spatial Chern-Simons vector $\zeta_{\mu} = (0, -\zeta_x, 0, 0)$ and orthogonal planes $\hat{k} = (\omega, k_2, k_3), \ \hat{x} = (x_0, x_2, x_3)$ In the entire space,

$$A_{1} = \int \frac{d^{3}\hat{k}}{(2\pi)^{3}} \,\,\theta(\omega^{2} - k_{\perp}^{2} - m^{2}) \,(\tilde{u}_{1 \rightarrow}(\omega, k_{2}, k_{3})e^{ik_{10}x_{1}} + \tilde{u}_{1 \leftarrow}(\omega, k_{2}, k_{3})e^{-ik_{10}x_{1}})e^{i\hat{k}\hat{x}}$$

where $k_{10}^2 = \omega^2 - m^2 - k_{\perp}^2$, $k_{\perp}^2 = k_2^2 + k_3^2$

Two solutions for other components in the different half-spaces taken both on entire axis.

For $x_1 > 0$ ($\nu = 0, 2, 3$) $A_{\nu} = \int \frac{\mathrm{d}^3 \hat{k}}{(2\pi)^3} \,\theta(\omega^2 - k_{\perp}^2 - m^2) \left(\tilde{u}_{\nu \to}(\omega, k_2, k_3) e^{ik_{10}x_1} + \tilde{u}_{\nu \leftarrow}(\omega, k_2, k_3) e^{-ik_{10}x_1}\right) e^{i\hat{k}\hat{x}}$

Arrows \rightarrow , \leftarrow for directions of particle propagation. For $x_1 < 0$ ($A = L, \pm$ eigenstates of suitable polarizations)

$$ilde{\mathcal{A}}_{
u} = \sum_{\mathcal{A}} \left[ilde{v}_{
u\mathcal{A}
ightarrow}(k_2,k_3,\omega) \delta(k_1-k_{1\mathcal{A}}) + ilde{v}_{
u\mathcal{A}
ightarrow}(k_2,k_3,\omega) \delta(k_1+k_{1\mathcal{A}})
ight]$$

The MCS dispersion laws for different polarizations,

$$\begin{cases} k_{1L} = k_{10} = \sqrt{\omega^2 - m^2 - k_{\perp}^2} \\ k_{1+} = \sqrt{\omega^2 - m^2 - k_{\perp}^2 + \zeta_x \sqrt{\omega^2 - k_{\perp}^2}} \\ k_{1-} = \sqrt{\omega^2 - m^2 - k_{\perp}^2 - \zeta_x \sqrt{\omega^2 - k_{\perp}^2}} \end{cases}$$

æ

- < ∃ →

< 🗇 🕨

Matching on boundary

Matching,

$$\begin{pmatrix} -k_{10}^{2}\left(-\frac{\tilde{u}_{0\rightarrow}-\tilde{u}_{0\leftarrow}}{ik_{10}}+\sum_{A}\frac{\tilde{v}_{0A\rightarrow}-\tilde{v}_{0A\leftarrow}}{ik_{1A}}\right)=i\zeta_{x}\left(k_{2}\sum_{A}\frac{\tilde{v}_{3A\rightarrow}-\tilde{v}_{3A\leftarrow}}{ik_{1A}}-k_{3}\sum_{A}\frac{\tilde{v}_{2A\rightarrow}-\tilde{v}_{2A\leftarrow}}{ik_{1A}}\right)\\ -k_{10}^{2}\left(-\frac{\tilde{u}_{2\rightarrow}-\tilde{u}_{2\leftarrow}}{ik_{10}}+\sum_{A}\frac{\tilde{v}_{2A\rightarrow}-\tilde{v}_{2A\leftarrow}}{ik_{1A}}\right)=-i\zeta_{x}\left(k_{3}\sum_{A}\frac{\tilde{v}_{0A\rightarrow}-\tilde{v}_{0A\leftarrow}}{ik_{1A}}+\omega\sum_{A}\frac{\tilde{v}_{3A\rightarrow}-\tilde{v}_{3A\leftarrow}}{ik_{1A}}\right)\\ -k_{10}^{2}\left(-\frac{\tilde{u}_{3\rightarrow}-\tilde{u}_{3\leftarrow}}{ik_{10}}+\sum_{A}\frac{\tilde{v}_{3A\rightarrow}-\tilde{v}_{3A\leftarrow}}{ik_{1A}}\right)=i\zeta_{x}\left(\omega\sum_{A}\frac{\tilde{v}_{2A\rightarrow}-\tilde{v}_{2A\leftarrow}}{ik_{1A}}+k_{2}\sum_{A}\frac{\tilde{v}_{0A\rightarrow}-\tilde{v}_{0A\leftarrow}}{ik_{1A}}\right)$$

Continuity of A,

$$\begin{array}{l} \widetilde{u}_{\nu \rightarrow}^{(L)} + \widetilde{u}_{\nu \leftarrow}^{(L)} = \widetilde{v}_{\nu L \rightarrow} + \widetilde{v}_{\nu L \leftarrow} \\ \widetilde{u}_{\nu \rightarrow}^{(+)} + \widetilde{u}_{\nu \leftarrow}^{(+)} = \widetilde{v}_{\nu + \rightarrow} + \widetilde{v}_{\nu + \leftarrow} \\ \widetilde{u}_{\nu \rightarrow}^{(-)} + \widetilde{u}_{\nu \leftarrow}^{(-)} = \widetilde{v}_{\nu - \rightarrow} + \widetilde{v}_{\nu - \leftarrow} \end{array}$$

Final relations

$$\begin{split} \tilde{u}_{\nu\to}^{(A)} &= \frac{1}{2} \big(\tilde{v}_{\nu A\to} \big(\frac{k_{1A} + k_{10}}{k_{10}} \big) - \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ \tilde{u}_{\nu\leftarrow}^{(A)} &= \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} + k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big) \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \tilde{v}_{\nu A\leftarrow} \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) \big) \\ &= 1 - \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big) \big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big) \big) \Big(\frac{k_{1A} - k_{10}}{k_{10}} \big) + \frac{1}{2} \big(-\tilde{v}_{\nu A\to} \big) \big) \Big)$$

In vacuum,

$$\mathcal{A}^{\mu}_{\rm vacuum}(x) = \int {\rm d}^3 \hat{k} \, \theta(\omega^2 - k_{\perp}^2 - m^2) \sum_{r=1}^3 \left[\, {\bf a}_{\,\hat{k}\,,\,r} \, u^{\mu}_{\,\hat{k}\,,\,r}(x) + {\bf a}^{\dagger}_{\,\hat{k}\,,\,r} \, u^{\mu\,*}_{\,\hat{k}\,,\,r}(x) \, \right],$$

Canonical commutation relations $[\mathbf{a}_{\hat{k},r}, \mathbf{a}_{\hat{k}',s}^{\dagger}] = \delta(\hat{k} - \hat{k}') \delta_{rs}$ In P-breaking medium $(A \in \{L, +, -\})$,

$$A^{\nu}_{\rm MCS}(x) = \int {\rm d}^3 \hat{k} \, \theta(\omega^2 - k_{\perp}^2 - m^2) \sum_A \left[\, c_{\hat{k},A} \, v^{\,\nu}_{\hat{k},A}(x) + c^{\,\dagger}_{\hat{k},A} \, v^{\,\nu*}_{\hat{k},A}(x) \, \right]$$

Canonical commutation relations, $\left[c_{\hat{k},A}, c^{\dagger}_{\hat{k}',A'}\right] = -g_{AA'} \,\delta(\hat{k} - \hat{k}')$ Matching,

$$v_{\hat{k},A}^{\nu}(\hat{x}) = \sum_{s=1}^{3} \left[\alpha_{sA}(\hat{k}) \, u_{\hat{k},s}^{\nu}(\hat{x}) - \beta_{sA}(\hat{k}) \, u_{\hat{k},s}^{\nu*}(\hat{x}) \right]$$

Bogoliubov transformation

$$\mathbf{a}_{\hat{k},r} = \sum_{A=\pm,L} \left[\alpha_{rA}(\hat{k}) \, c_{\hat{k},A} - \beta_{rA}^{*}(\hat{k}) \, c_{\hat{k},A}^{\dagger} \right] \quad c_{\hat{k},A} = \sum_{r=1}^{3} \left[\alpha_{Ar}^{*}(\hat{k}) \, \mathbf{a}_{\hat{k},r} + \beta_{Ar}^{*}(\hat{k}) \, \mathbf{a}_{\hat{k},r}^{\dagger} \right]$$

Two different Fock vacua

$${f a}_{\,\hat{k},\,r}|0
angle=0\qquad c_{\,\hat{k},A}\mid\Omega\,
angle=0$$

From Bogoliubov tranformation,

$$\begin{split} |0\rangle &= \mathcal{N} \exp\left[\int \mathrm{d}^{3}\hat{k}\,\theta(\omega^{2} - k_{\perp}^{2} - m^{2}) \times \right. \\ &\times \left\{ \frac{\beta_{r+}^{*}(\hat{k})}{2\alpha_{r+}(\hat{k})} (c_{\hat{k},+}^{\dagger})^{2} + \frac{\beta_{r-}^{*}(\hat{k})}{2\alpha_{r-}(\hat{k})} (c_{\hat{k},-}^{\dagger})^{2} + \frac{\beta_{rL}^{*}(\hat{k})}{2\alpha_{rL}(\hat{k})} (c_{\hat{k},L}^{\dagger})^{2} \right\} \right] \mid \Omega \rangle \end{split}$$

and inversely

$$\begin{split} | \Omega \rangle &= \tilde{\mathcal{N}} \exp \left[\int \mathrm{d}^{3} \hat{k} \, \theta(\omega^{2} - k_{\perp}^{2} - m^{2}) \times \right. \\ & \left. \times \left\{ \frac{-\beta_{A1}^{*}(\hat{k})}{2\alpha_{A1}^{*}(\hat{k})} (\mathbf{a}_{\hat{k},1}^{\dagger})^{2} + \frac{-\beta_{A2}^{*}(\hat{k})}{2\alpha_{A2}^{*}(\hat{k})} (\mathbf{a}_{\hat{k},2}^{\dagger})^{2} + \frac{-\beta_{A3}^{*}(\hat{k})}{2\alpha_{A3}^{*}(\hat{k})} (\mathbf{a}_{\hat{k},3}^{\dagger})^{2} \right] \right\} \left] | 0 \rangle \end{split}$$

- Local (finite-volume) PB is not forbidden by any physical principle in QCD at finite temperature/density
- The effect leads to unexpected modifications of the in-medium properties of vector mesons and photons
- LPB seems to be capable of explaining in a natural way the PHENIX 'anomaly'
- ▶ Boundary enhancement of in-medium ω decays + LPB → broadening of ω resonance in fireballs (observed on PHENIX!)
- Axion stars discovery from exotic photon spectra (boundary effects)??
